Threshold set at $120\% \pm 10\%$ of maximum current.

General

- **Over-Temperature Protection:**
Shutdown if temperature exceeds $+105 \pm 5 \text{ }^\circ\text{C}$.

Functions and Signals

ENABLE* (pin D2)

This signal is used to enable the input power of the converter.
Connect this pin to **SIGNAL_RTN** (pin D1) to enable input power.
Leave open to disable input power.

INHIBIT* (pin C2)

This signal is used to disable the main output of the converter.
Connect this pin to **SIGNAL_RTN** (pin D1) to disable the main output power.
Leave open to enable the main output power.

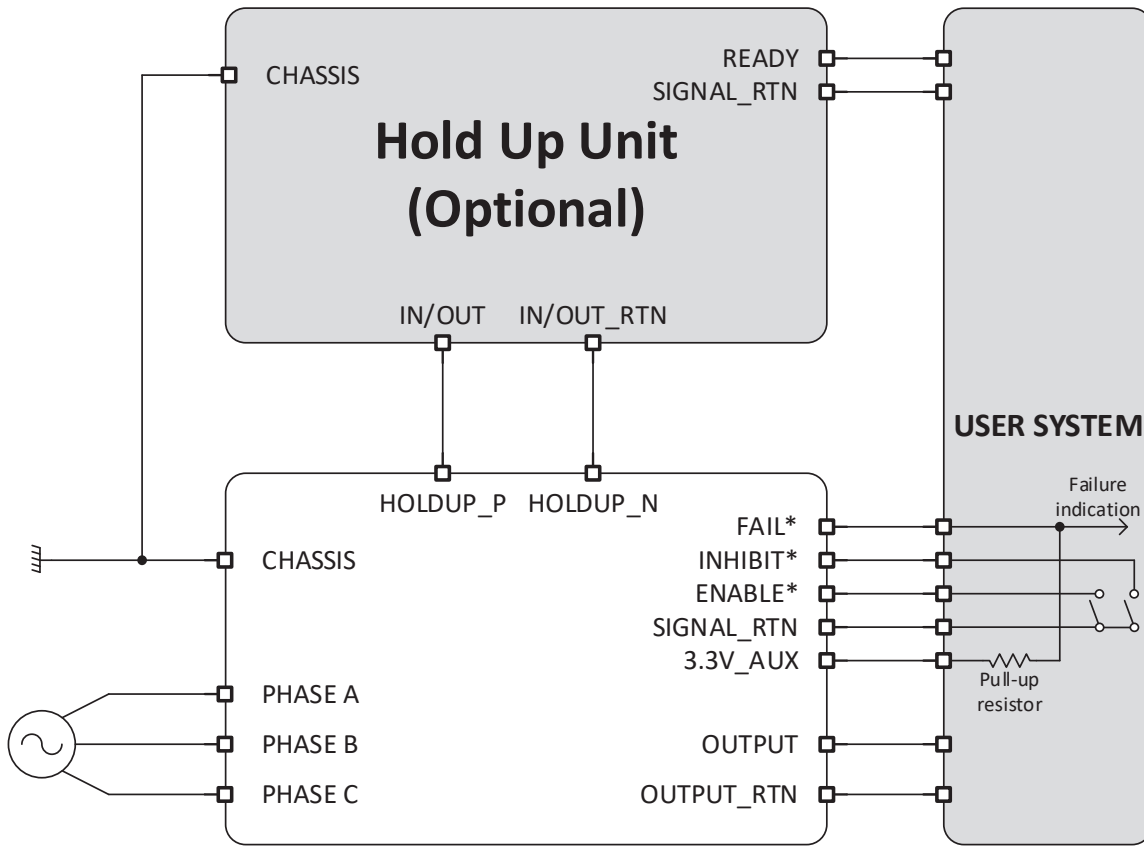

FAIL* (pin C3)

This signal indicates the status of the outputs.
If the any of the output voltages drop below $85\% \pm 5\%$ the signal will go 'high'.
In case any of the output voltages rise above $90\% \pm 5\%$, the signal will be 'low'.
Typical hysteresis for main output (example is 28 V) is 2%.
Typical hysteresis for 3.3V_AUX is 0.5%.
Signal type: Open-drain (connect an external pull-up resistor to 3.3V_AUX for voltage indication).
This signal is referenced to **SIGNAL_RTN** (pins D1)

HOLDUP P/HOLDUP N (pin LP9/LP11)

These pins are connected to the internal DC bus of the converter (the rectified input voltage).
Connect these pins to the appropriate pins of the Hold up Module to add a holdup feature to the converter to provide a transparent ride-through during power interrupt events, IAW MIL-STD-704A-F.
